Description:

I included the required libraries declared required variables created a structure name rescue for storing the information of Emergency requests

Main function: first I displayed the choice of actions a user can select to do like register a request, display all requests, assign teams for the requests(In priority order), Search for a specific request, summary of the requests in the storage. When the User clicks any of these options they can perform that action by the system calls the function.

Register request function: It can hold a limited number of requests only. The request id is generated automatically by incrementing the existing request id by 1.Then the user needs to fill all the other details manually such as location, people count, emergency level, needed resources and status is automatically set to "Pending. The count for critical or normal cases is increased based on the emergency level for future use. The records are sorted based on the priority (HIGH - critical), (LOW - normal) if it is tied then it prioritizes based on the people count (HIGH - greater count), (LOW - lesser count). Send a Success message to the user.

Display function: It traverses the records and displays them one by one based on the order of priority.

Assigning function: It helps us to assign the team for the higher priority request and change the pending status and emergency level's counts.

Search function: It asks for a searchId for searching a specific emergency request. Then it searches the storage and shows the requested details.

Summary function: It summarizes the count of Critical pending requests, Normal pending Requests, how many requests are assigned with a rescue team.

The main function runs until the user wants to finish their work.

OUTPUT:

Code Compile and RUN:

```
C:\Users\SIVARAJ Y\Desktop\C_CodeCraft26>gcc scenario1.c -o scenario

C:\Users\SIVARAJ Y\Desktop\C_CodeCraft26>scenario.exe
```

Showing the action options to User:

```
--- Emergency Rescue System ---
1. Register Emergency Request
2. Display Records
3. Assign Rescue Team (not implemented)
4. Search a Request
5. Generate Emergency Summary
6. Exit
Enter your choice: 1
```

Option 1 (Register Request):

```
Enter your choice: 1
Enter Location: sathy
Enter people count: 50
Emergency Level (critical/normal): critical
Needed resources: ambulance
Request registered successfully!
Enter your choice: 1
Enter Location: sathy
Enter people count: 25
Emergency Level (critical/normal): normal
Needed resources: ambulance
Request registered successfully!
Enter your choice: 1
Enter Location: erode
Enter people count: 2
Emergency Level (critical/normal): critical\
Needed resources: ambulance
Request registered successfully!
```

Option 2 (Display):

```
Enter your choice: 2

Request ID : ER001
Location   : sathy
People     : 50
Emergency  : critical
Resources  : ambulance
Status     : Pending

Request ID : ER003
Location   : erode
People     : 2
Emergency  : critical\
Resources  : ambulance
Status     : Pending

Request ID : ER002
Location   : sathy
People     : 25
Emergency  : normal
Resources  : ambulance
Status     : Pending
Enter your choice:
```

Option 3 (Rescue Team assigning):

```
Enter your choice: 3
Rescue Team is assigne for the requestID : ER001Enter your choice: 4
Enter Request ID: ER001
```

Option 4 (Request searching):

Option 5 (Records Summary):

Option 6 (Closing the system):
